Descriptions:

For this project, our team has decided to develop an Android application that will substitute SAFEwalk. The overall goal for this project is to simplify the process of requesting someone to walk with. The current process to request walkers from SAFEwalk is outdated and requires you to send information over text message or a phone call. This slow process has turned some users away from the SAFEwalk program.

Initially, this application will branch off into two separate functionalities, one for the users and one for the walkers. On the user side, the user will be able to create an account, locate where they are and their destination, and then simply request a walker. On the walker side, any person that will have a walker account would be notified of the request, accept or decline the request, communicate between other walkers or clients, along with other features that could be implemented depending on time constraints. The client for this application will be the members of the Pi Beta Phi sorority. The main target persona is female students, active on campus.
